Data Models

Asset Information: Critical Enabler and Risk

Asset Information is critical to decision making

Poor data quality increases risk and cost to service

Siloed data management leads to inefficient decision making

Data management is costly and needs to be prioritised

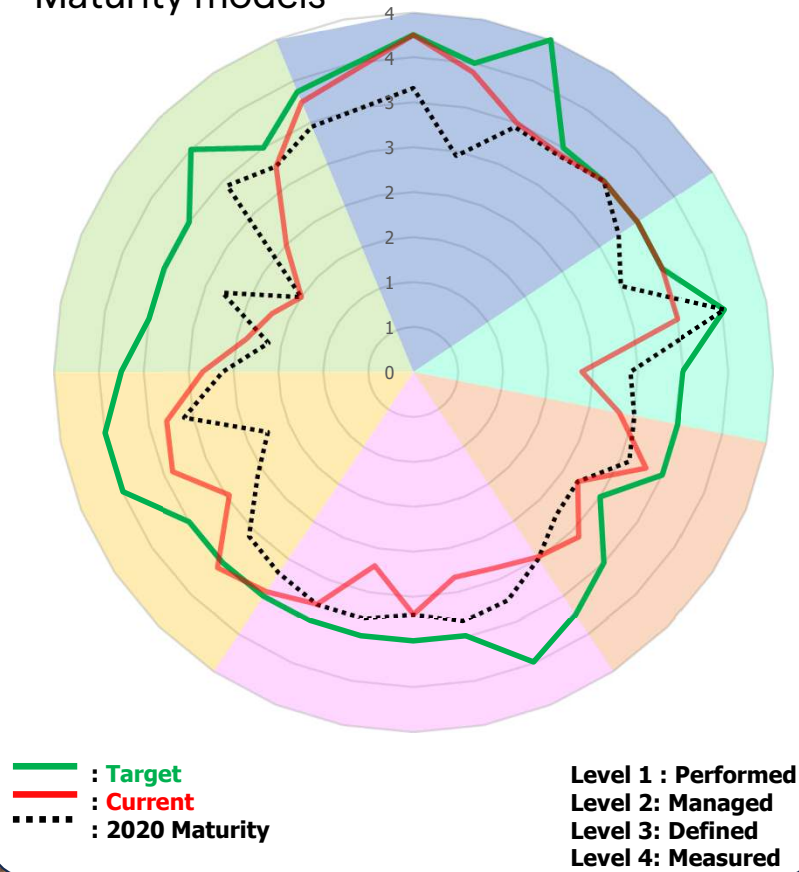

Shared challenges

Governance
Data Quality
Training and Awareness
Accessibility
Fragmentation
Data sharing

Where to start

Maturity models

Build capability & systems

Governance: Don't rely on technology solutions ... governance can look at operating models & processes

Data Quality: Don't boil the ocean ... start with critical data elements and automated emails

Training and Awareness: Don't make it everyone's problem, and build in accountability to project delivery

Accessibility: Are you locked out of your own data and why?

Fragmentation: Connecting data can be done without expensive middle ware or data fabrics

Data sharing: Challenging due to the way our sector is divided but it can be done
