

Tricky Washer Placement

An ElectroNet Lines Supervisor working on the BPE-HAY line was as frustrated as his fellow workers when they encountered difficulty installing flat washer's into position between deeply set steel members. Not only was there an increased risk that washers could be dropped, but the washer placement was taking a long time to achieve.

The Lines Supervisor took it upon himself to design and manufacture a tool which could accurately position a spacer washer in between the steel members and hold it in place while the bolt was installed.

The tool was an innovative idea and clear evidence that the Lines Supervisor is focused on ways in which to not only work safely, but also efficiently.
