Association

Bushfire Resilience Breakfast

Thursday 24 September 2025 · 7.00am – 8.15am

NZICC, Auckland

Bushfire Resilience Breakfast

Purpose

Climate change and associated weather extremes increase the potential for wildfires and the dangers this creates for electricity networks, communities and the environment.

Across Europe, the Mediterranean, North America and Australia, wildfires are more frequent and destructive and fire seasons longer, with significant implications for utilities in these regions. New Zealand is not immune to changing weather patterns and has seen the destruction wrought by large fires on the Port Hills, at Lake Pukaki - Ōhau.

The EEA's 2025 Resilience Guide provides comprehensive guidance around wildfire risk analysis and fire risk management and mitigation. When it comes to operations, networks take varied approaches and there is a lack of best practice guidance.

Operations during and after a wildfire

Join industry colleagues in an interactive discussion to identify:

- the biggest operational wildfire risks and priorities as our industry sees them
- opportunities for knowledge sharing and industry collaboration
- any need for new operational guidance or standardised processes

Our keynote speaker and a panel with lived New Zealand and Australian experience will spur the morning's thinking

Hear from keynote speaker Jamie Cowan, Consultant Fire Investigator and expert, who brings over 18 years of domestic and international experience in wildfire management and incident management systems, and has been an expert witness on some of New Zealand's biggest recent fires. Jamie will be joined by Tim Mitchell of FENZ, Steve McDonald of Orion, and Marko Simunac of Vector, for an interactive session discussing their experience across preparation, response and recovery. Meet other stakeholders working on the same priorities as you and help structure our industry's approach to what we do next.
